Diagnostic Imaging of the Foot and Ankle—Ursile Stroom 2014-12-17 The foot has a special place in musculoskeletal diagnosis due to its complex anatomy and because many similar symptoms can have different causes, each requiring a different approach to treatment. The evaluation of foot disorders and diseases requires clinical findings to be augmented by ancillary investigations from different radiological techniques, such as X-ray with age, due to the small differences in the recording of the normal and degenerative processes of the foot and ankle. The foot's three-dimensional structure is complex and contains many soft tissues and bone structures, which can be damaged by disease and trauma. The most important imaging procedures used in the evaluation of foot and ankle disorders are conventional radiographs and its variants, CT, MR imaging, and ultrasound. Of these, CT and MR imaging are the most widely used and are the most appropriate techniques for evaluating bone and soft tissue injuries. The foot surgeon will have to decide which imaging technique is most suitable for a particular patient, based on the clinical presentation and the findings at surgery. The foot surgeon will also have to decide which imaging technique is best suited for each diagnostic problem, and which techniques are most appropriate for pre-operative planning and post-operative imaging.

Bone and Joint Disorders of the Foot and Ankle—Mauro Bosyrat 2013-06-17 This book presents the latest radiological imaging techniques and new imaging strategies that may not rely on their interpretation.
